

unit 2

url parameters

moving data between pages

unit 2 day one goals

- take our sample in unit 2: origin and destination
- create one page per team member
- on each page, integrate the ability to read url parameters from a source page, then output the values of each url parameters into a set of inputs, or the console
- integrate the origin code into page #2 (photo upload page), to pass each page the facebook id of the person logged in, and the name of the photo
- you'll need one link per team member page on page 2, sending the same links to each page

group project #2

- establish one page to:
- update some facts about the photo
- get current facts about the photo
- delete the photo and the current facts about it
- establish a navigational element that is consistent across all pages
